Continuation of 5. does NOT place the application in condition for allowance because: the rejection of claims 5-7 under 35 U.S.C. §101 and §112, 1st paragraph remains.

I. Claim rejection under 35 U.S.C. § 101

The instant specification fails to to satisfy the utility requirement set forth under 35 U.S.C. § 101 for the following reasons, as well as for the reasons set forth in the previous office actions (Paper No. 9 and Paper No. 12).

Applicants argue that the refences of Bork and Koonin, Ji, and Yan, do not support the Examiner's position in rejecting claims 5-7 for lack of a patentalble utility. This has been fully considered but is not deemed to be persuasive for the following reasons.

Bork and Koonin's conclusion' remarks clearly indicates that the potential importance of sequence analysis in extracting functional signal. However, Bork and Koonin do not teach, in any means, that sequence analysis alone can define the biological functions. In fact, Bork and Koonin further teach many proteins are multifunctional, assignment of a single function, which is still common in genome progects, results in loss of information and outright errors (Table 2). As the Examiner stated in the previous office in paper No. 12, while sequence analysis is important, the information provided or "predicted" based upon sequence homology can only be used as guidance in determining functions or activities of a molecule by experiments. Any functions predicted based upon the sequence homology will have to be confirmed ultimately by bench work.

Applicants also argue tht an exact quote from Ji completely undermines the question of asserted utilty based on sequence homology. The Examiner disagrees. The cited statement simply indicates that a substancial degree of amino acid homology is found between members of a particular subfamily. However, two sequences sharing certain degree homology may not necessarily belongs to the same subfamily. In addition, the instant disclosure merely asserts that the the polynucleotides of the present invention encode proteins that share sequence similarity with mammalian membrane ligand proteins or transporter proteins (1st paragraph of page 2). The disclosure fails to specify a functional protein which the protein of the present invention shares sequence homology with and the degree of homology. Ji also clearly teach there are putative seven transmembrane molecules, which do not appear to be coupled to a G protein. Even if the protein of the present invention were a member of the GPCR family, it would still not provide a patantable utility for the claimed invention because it still requires undue experimentation to define the specific biological function of the present protein or nucleic acid.

Applicants further argue that Yan does not suggest a high level of uncetrainty in assigning function based on sequence, and thus does not support the lack of utility. Specifically, applicants argue that the different receptors bound by the two isofroms of ectodysplasin are related and EDA-A2 receptor was correctly identified as a member of the tumor necrosis factor receptor superfamily based upon solely on sequence similarity. The Examiner notes that while the two receptors bound by the two isofroms of ectodysplasin are related, i.e., belonging to the TNFR superfamily, they have different activities (See, e.g., page 524, column 3) and are distinct receptors. Even the title of the paper clearly states that the two receptors bound by the two isofroms are distinct. The Examiner further notes that while the EDA-A2 receptor was initially identified as a member of the TNFR superfamily solely based on sequence similarity, as applicants argued, the biological functions of the receptor was not identified. In fact, Yan et al. performed undue experimentation to define the ligand and biological activies of the receptor. As taught by Yan, the members of the TNFR superfamily are involved in a number of physiological and pathological response by activating a wide variety of intracellular signaling pathways (beginning of page 523). The EDA-A2 receptor (XEDAR) fails to bind many known ligands of the TNFsuperfamily (1st column of page 524). Therefore, even if sequence analysis could assign a given protein to a protein family, the protein still does not have a substantial utility because the biological function or activity is not defined. Determining such a biological function of the protein would require significant further research, as demonstrated by Yan, which is not allowed undr 35 U.S.C.§ 101.

In addition, applicants continue to argue for the issues of record (Paper No. 11, December 5, 2002). Applicants' arguments were addressed in the previous office action in Paper No. 12.

II. Claim Rejections Under 35 U. S. C. §112, 1st Paragraph

Claims 5-7 are rejected under 35 U. S. C. 112, 1st paragraph. Specifically, since the claimed invention is not supported by either a specific, substantial, and credible utility, or a well-established utility, one skilled in the art clearly would not know how to use the claimed invention. The applicants' arguments about the patentable utility of the claimed invention has been fully considered but is not deemed to be persuasive for reason set for the above.
